

METAL

$f(x)$ = Engineering + Fabrication + Integration

Renewable Energy/Solar

METALfx's quick response allows customers in emerging markets to meet aggressive design, pilot, and production schedules. We support one of Northern California's largest provider of PV integration products. We also offer concurrent engineering as a method of reducing manufacturing costs and time to market. We embrace the opportunity to work on GREEN projects, such as the NightBreeze.

In this highly technical field METALfx provides experienced engineering capabilities to our customers. Our Engineering CAD Network is configured to provide a direct upload and download capability with participating customers, utilizing multiple formats, as well as uploading and downloading to our FTP site or from your FTP site. Our programmers then utilize this system for unfolding your 3D CAD files and developing programs for our direct-linked CNC manufacturing equipment. This system helps us to provide rapid response for engineering changes and prototype projects for our customers, as well as providing support to our daily production requirements.
